

Notes on Homework #7 You Just Submitted
(C Programming for Beginners)

How do you create a modular program in C? You can write a modular code which allows you to better manage a large application. Modularity is achieved by breaking the codes into multiple compilation units (eg. Multiple *.h, and *.c files), multiple functions in each file. You should not have global variables, but the data needed by functions are passed around as parameters or return values.

Please review the model solution and make improvement in your code if needed.
